

o MILESTONE 4: Frontend Development with Streamlit – LegalEase

In this milestone, we develop the Streamlit interface so users can enter document details, send them to the backend, preview and edit the generated draft, and download the result.

Activity 4.1: Create the User Input Form

1. Build the Streamlit Page

Create a page title and input fields for document type, parties, terms, and effective date.

app.py – input form

```
import streamlit as st

st.title("LegalEase - Legal Document Generator")

document_type = st.text_input("Document Type")
parties = st.text_area("Parties Involved")
terms = st.text_area("Terms and Conditions")
dates = st.text_input("Effective Date")

if st.button("Generate Document"):
    # Send inputs to the backend
    pass
```

Activity 4.2: Connect the Frontend to FastAPI

1. Prepare the JSON Payload

Collect the values from the input fields in a dictionary.

JSON payload and API request

```
import requests

payload = {
    "document_type": document_type,
    "parties": parties,
    "terms": terms,
    "dates": dates,
}

response = requests.post(
    "http://localhost:8000/generate",
    json=payload
)
generated_text = response.json()["document"]
```

Activity 4.3: Preview and Edit the Generated Document

1. Display an Editable Preview

Show the returned document in a text area so the user can review and edit the draft.

Editable document preview

```
edited_text = st.text_area(
    "Document Preview / Edit",
    value=generated_text,
    height=400
)
```

Activity 4.4: Add Download Buttons

1. Download the Document as TXT

Add a download button for edited text. DOCX and PDF buttons can call the formatter functions.

TXT download button

```
st.download_button(
    label="Download as TXT",
    data=edited_text,
    file_name="legalease_document.txt",
    mime="text/plain"
)
```
